

CHALLENGE 07 / 20

The Fileless Invoice

ARTIFACTS / DIGITAL FORENSICS

DOMAIN	Digital Forensics / Endpoint Artifact Investigation
CASE TYPE	Fictional / Synthetic Student Project
PRIMARY GOAL	Investigate • Correlate • Reconstruct • Report

POWERED BY SYNTHOQUEST PVT LTD

Fictional challenge • No real company, person, device or private evidence is required.

01 | CASE SCENARIO

Incident Background

A fictional accounting team notices that an invoice-related action appears to have taken place, but the expected invoice document is not present in its normal project folder. Employees remember seeing the document, yet the visible file system no longer tells the whole story.

Investigators therefore need to use surrounding digital activity such as application usage, user sessions, browser/download records, timestamps and related artifacts. The absence of the main file should not stop the investigation.

The challenge is to reconstruct the event from indirect traces and clearly distinguish a supported finding from an assumption.

Why the Case Needs Investigation

The organization has enough uncertainty that a simple assumption is not acceptable. Investigators need to combine multiple activity sources, identify the events that belong together, reconstruct the order of activity and document the reasoning behind each important finding.

Investigation principle: Do not treat one record as the complete story. The solution should help an investigator correlate multiple records and clearly distinguish confirmed information from interpretation.

02 | PROBLEM STATEMENT

The Fileless Invoice

Build a digital forensics investigation solution for the fictional case **The Fileless Invoice**. The system should help an investigator organize relevant digital activity, search and filter records, correlate related events, reconstruct a chronological timeline and produce a professional final report. The project is not about obtaining real-world evidence; participants may create synthetic data to demonstrate the workflow.

The solution should be designed as a practical investigator-facing product rather than only a collection of scripts.

03 | WHAT STUDENTS NEED TO BUILD

- Artifact correlation
- User activity
- Application activity
- Browser/download analysis
- Timeline
- Search/filtering
- Finding management

04 | SUGGESTED INVESTIGATION FLOW

01	CASE CREATION	Create case ID, team/investigator details and case status.
02	DATA INPUT	Import or enter structured synthetic/sample activity data.
03	ANALYSIS	Search, filter and inspect relevant activity.
04	TIMELINE	Arrange important events in chronological order.
05	CORRELATION	Connect related records and identify event relationships.

06	FINDINGS	Record observations and supporting details.
07	REPORT	Generate the final investigation report.

05 | INVESTIGATION QUESTIONS

- What activity indicates the invoice event?
- When did it happen?
- Which applications/accounts were involved?
- Which artifacts support it?
- What cannot be proven?

06 | SYNTHETIC DATA FOR DEMONSTRATION

Teams may create fictional records to demonstrate their application. Suggested records can include users/sessions, file activity, application activity, device activity, browser or email metadata, system events and timestamps. No real personal, company or confidential information is required.

DATA CATEGORY	EXAMPLE FIELDS
User / Session	Username, session ID, login/logout time, status
File Activity	Filename, path, action, timestamp, user
Device Activity	Device name, identifier, connection/disconnection time
Application Activity	Application, execution time, user, related file
Browser / Email	URL/message metadata, timestamp, attachment/download
System Events	Event type, timestamp, source, description

07 | EXPECTED FINAL OUTPUT

- **Working Investigation Tool** — functional end-to-end workflow.
- **Case Dashboard** — case information and status.
- **Analysis Views** — organized activity and artifacts.
- **Incident Timeline** — chronological reconstruction.
- **Correlation / Findings** — related events and documented observations.
- **Final Report** — professional investigation summary.
- **Source Code + README** — setup and execution instructions.
- **Live Demo** — clear demonstration to judges.

08 | FINAL REPORT FORMAT

- Case Summary
- Investigation Objective
- Data / Synthetic Inputs Used
- Methodology
- Incident Timeline
- Findings
- Supporting Details / Screenshots
- Conclusion
- Limitations

09 | EVALUATION AREAS

- Understanding of the scenario
- Technical implementation
- Forensic analysis workflow
- Timeline quality
- Event correlation
- Clarity of findings
- User interface/investigator experience
- Final report
- Demo and explanation

10 | CONSTRAINTS

- This is a fictional hackathon case.
- Do not use real people's private or confidential information.
- Synthetic/sample data may be created by participants.
- Do not present synthetic data as evidence from a real incident.
- Conclusions should be based on the data and functionality demonstrated by the project.

11 | CHALLENGE GOAL

Build a digital forensics solution that helps an investigator understand the incident, reconstruct the timeline, correlate relevant activity and produce a professional investigation report.
